We will be aware of what we have done with our weekly updates. We will get some idea about the work of our back end.

### **Literature review:**

We have started the work of admin panel on our website. We have done the work of the admin panel on our website in such a way that the categories and brands that the admin adds are stored in the database and if the admin adds the same category or brand, it will give a message that the same category has been loaded. We have managed to connect the database to the project.

Through which whatever category (shoes, pants,) or brand (Adidas, Aarong) the admin updates, if it is the same (if the admin gives the same category or brand name, it will give a message that you have updated the same category brand) from each other, then it will be updated in the database. Compared to the previous website, our website will have search option, welcome guest option. We have created admin panel with the help of get variable. If the admin wants to update something in the category, then after clicking (insert) we will see the insert option. we were able to connect to the database. In the future, we will work on the security issue so that the user or the admin does not fall into any kind of trouble.

### **Proposed solution:**

**Problem solved:** This issue has been partially resolved. I will work more on this problem in the future.

3. Inefficient Inventory and Order Management: Businesses struggle with integrating inventory, order processing, and real-time tracking, which results in delayed shipments, stockouts, and poor customer experiences.

**Weekly progress:** We have redesigned our website using PHP. Now we have started working on the backend. We have created a row of categories where our admin can update their work category and brand as per their wish. Admin can insert by going to insert category or insert brand from admin panel through get method. If the same name has a brand or category, it will detect it and give a message. Admin whatever band direction or category direction will be stored in database table through SQL. We have added two tables to our database. Through which the data provided by the admin will be saved. We will add more beautiful fitters in the future. I will add our admin panel to the main website.

**Conclusion:** This week we've been able to do very little work due to issues with some of our VS code, causing a lot of trouble running the PHP code. In the future we will include different pages on our website.
